BISTS characteristics:

Solar collector:

Glazed flat plate water collector

Dimensions: 3000 mm length, 95 mm width

The solar system is a combined system, contributing to both domestic hot water preparation and space heating.

- Heated area: 479 m² office area + 1389 m² production hall
- 80 m² façade integrated solar collectors (directly south oriented)
- Heat store: 950 l water heat store
- Auxiliary heating: Bio diesel block heat and power plant
- Heat distribution: wall and floor heating

BISTS description and context

The head quarter of the Austrian solar collector producer AKS DOMA Solartechnik was, at the opening in spring 1999, one of the first buildings with CO₂ neutral energy supply. The energy and electricity demand for the offices with 470 square meters and the production hall with a floor area of 1,380 m² is covered exclusively from renewable energies. The heat distribution in the office building is performed via a wall heating system. The production hall is heated via a floor heating system integrated in the concrete floor. The concrete floor (90 cubic meters) is used both as a radiator as well as a heat store. As a result of the excellent thermal insulation of the building and the corresponding dimensioning of the wall- and floor heating systems, the system can be operated with very low flow temperatures. These low supply temperatures offer ideal conditions for the operation of the solar thermal plant.

INSTRUCTIONS

Please fill in as much information as possible.

Tick where appropriate.

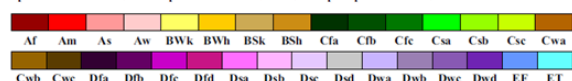

Text in red is suggested guidance. Insert information in provided space, removing red text as appropriate

If possible, use metric values.

If necessary, supply additional information on separate sheets

Reference listing**Köppen climate classification****World Map of Köppen–Geiger Climate Classification**

updated with CRU TS 2.1 temperature and VASCLIM v1.1 precipitation data 1951 to 2000

**Main climates**

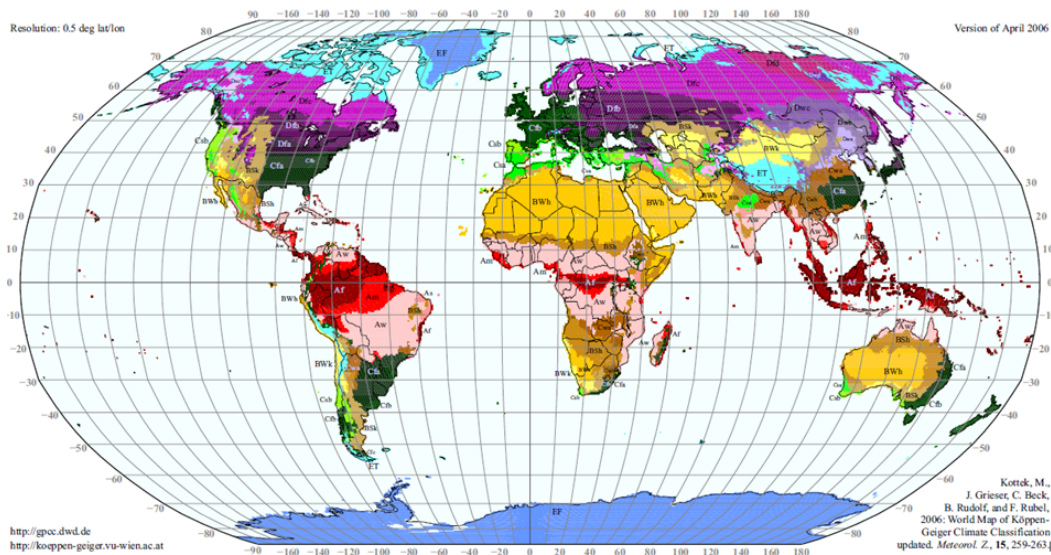

A: equatorial
B: arid
C: warm temperate
D: snow
E: polar

Precipitation

W: desert
S: steppe
f: fully humid
s: summer dry
w: winter dry
m: monsoonal

Temperature

h: hot arid
k: cold arid
a: hot summer
b: warm summer
c: cool summer
d: extremely continental
F: polar frost
T: polar tundra

(Kottek, M., J. Grieser, C. Beck, B. Rudolf, and F. Rubel, 2006: World Map of Köppen-Geiger Climate Classification updated. Meteorol. Z., 15, 259-263.)

Reijenga classification

The integration of PV systems in architecture can be divided into five categories:

1. Applied invisibly
2. Added to the design
3. Adding to the architectural image
4. Determining architectural image
5. Leading to new architectural concepts.

(Reijenga, TH and Kaan, HF. (2011) PV in Architecture, in Handbook of Photovoltaic Science and Engineering, Second Edition (eds A. Luque and S. Hegedus), John Wiley & Sons Ltd, Chichester, UK)

Rush classification

The architectural/visual expression of building services systems are identified as:

- Level 1. Not visible, no change
- Level 2. Visible, no change
- Level 3. Visible, surface change
- Level 4. Visible, with size or shape change
- Level 5. Visible, with location or orientation change

(Rush, RD. (1986) The Building systems integration handbook Wiley, New York, USA)
